

SafeGuard AI

The Idea

A smart AI vehicle security system that learns a car's environment and owner's habits to detect threats early with mobile alerts and less false alarms

The Target

SafeGuard AI aids vehicle owners, commercial fleets, and insurers by providing smart, early warnings to stop theft or tampering. Users without data or SMS can optionally recieve critical alerts via voice calls, ensuring broad, inclusive protection for all vehicles.

What it Solves

SafeGuard AI solves vehicle theft, tampering, false alarms from traditional car alarms, and the lack of real-time vehicle monitoring by learning a vehicle's normal environment and owner's routine. It delivers alerts only for truly suspicious activity. It offers customizable settings and SMS or voice options for broader access, restoring trust and providing reliable protection.

How it works

SafeGuard AI will be developed as a smartphone app linked to a compact vehicle device that gathers motion, vibration, and GPS data. The AI learns typical patterns and delivers real-time alerts for abnormal activity. Offline alerts via local Bluetooth handle situations without mobile data. Prototype testing with real users will refine accuracy and reliability.
